

## **POLICY POSITION**

### **7. COMBATING PRESCRIPTION DRUG TRAFFICKING AND ABUSE**

#### **BACKGROUND**

When taken properly, opioids, which are synthetic versions of opium and include drugs such as morphine, codeine, oxycodone and others, can help people deal with chronic pain. However, they can become addictive or be used for nonmedical means. Oftentimes, these drugs are obtained from friends and family members, but the growing number of pain clinics that supply drug dealers and addicts with illicit prescription painkillers has contributed to the spread of prescription pain medication abuse.

A 2011 study by the Substance Abuse and Mental Health Services Administration, a division of the U.S. Department of Health and Human Services, found that treatment admissions for prescription pain pill abuse quadrupled nationally from 1999 to 2010, and that this increase spans every age, gender, race, ethnicity, level of education and employment, and region of the country. Even more alarming, according to a report by the Centers for Disease Control and Prevention, overdoses from prescription drugs in the United States doubled from 1999 to 2007, and each year more than 20,000 people die from overdoses, far more people than are killed by controlled substances such as cocaine and heroin. In addition, the South has one of the highest rates of overdose related to prescription drug abuse and misuse and, in many states, it has become the primary cause of accidental death. Furthermore, many Southern states have become major hubs for trafficking prescription drugs along the “pill mill pipeline.” In response, several SLC states have passed legislation in recent years to increase prescription drug tracking programs and expand treatment and education programs for prescription drug abuse. One SLC state, Kentucky, has passed legislation to formally join The Council of State Governments’ Prescription Monitoring Program Compact.

National Drug Control Policy Director Gil Kerlikowske has called prescription drug abuse the nation’s “fastest-growing drug problem,” and last month he revealed a new strategy by the White House to reduce misuse of such drugs by 15 percent in five years through a nationwide education campaign; training for clinical practitioners; and establishing prescription drug monitoring programs in all 50 states (currently, only 35 states are operating such programs). In addition, the U.S. Food and Drug Administration is asking manufacturers of pain medications to assist in supplying materials that physicians can use while counseling patients on the risks and benefits of using prescription pain medications.

#### **RECOMMENDATION**

The Southern Legislative Conference of The Council of State Governments urges the federal government to further evaluate the public health impacts that the proliferation of prescription drug abuse and trafficking have on the Southern region and the nation, and to offer assistance in collaborative efforts to combat this epidemic.

In addition, the Southern Legislative Conference of The Council of State Governments urges Southern states to work together to develop strategies for addressing this trend, such as sharing information regarding education campaigns; creating task forces; expanding treatment assistance programs; developing prescription drug electronic monitoring systems; and/or participating in The Council of State Governments’ Prescription Monitoring Program Compact.
